Table S3. Variables used in cypsela morphometric analysis of the studied *Santolina* populations native to France and south-eastern Spain.

Code	Description of the variables
Perim	Perimeter, calculated from the centres of the boundary pixels
Area	Area defined by the perimeter
Breadth	Length of the second longest axis perpendicular to the first longest axis
Rectang	Rectangularity = Area/(First largest axis length × Width)
Solidity	Solidity = Area/Area of the convex hull
Concavity	Area of the convex hull - Area
Convexity	Convexity = Convex Hull/Perimeter
AspRatio	Aspect Ratio = First longest axis length/Width
Shape	Perimeter ² /Area
RFactor	(2 × radius of the inscribed circle centred at the centre of mass)/First longest axis length
Sphericity	Radius of the inscribed circle centred at the centre of mass/Radius of the enclosing circle centred at the centre of mass
Circ	Circularity = $4 \times \pi \times \text{Area} / \text{Perimeter}^2$

Table S4. Occurrence points used for the niche analysis in *Santolina* taxa and morphotypes native to France and south-eastern Spain. The first column follows the provisional taxonomic treatment proposed by Giacò et al. (2021). Occurrence points were categorized (second column) based on the results of the morphometric analyses: Ben-LC (typical *S. benthamiana* morphotype), Ben-rou (Le Roumenga morphotype), Dec-LC (typical *S. decumbens* morphotype), Dec-lfo (La-Fare-les-Oliviers morphotype), Dec-sis (Sisteron morphotype), and Eri (*S. ericoides*). In the last column, the source of information is reported (ANTHOS = <http://www.anthos.es>, SILENE = <http://flore.silene.eu>).
